

M3Jar — Phase 4B Hardening Final Report

Stripe Webhook Concurrency · Mobile TypeScript Baseline

Executive Summary

Phase 4B delivered two hardening objectives: (1) reduce the mobile TypeScript error count from 28 to zero across 16 files, and (2) add a real-PostgreSQL concurrent Stripe webhook stress test that proves exactly-once financial posting. The test surface exposed three production bugs in the webhook handler that were fixed as part of this pass.

Errors

Deep path imports (8 files): Switch @workspace/api-client-react/src/generated/api.schemas !' public export useQueryClient source: Move from @workspace/api-client-react !' @tanstack/react-query in create-jar/

review.tsx

queryKey required (TQ v5 / orval 8.x): Import & pass getXxxQueryKey() at every UseQueryOptions site (jar/[id].tsx + 3 files)

layout.tsx hook shape: Fix useListNotifications(undefined, { query: {...} }) parameter order

Global activity query: Disable with enabled:false — no jarId in global tab context

register.tsx DimensionValue: Add explicit return type annotation to getPasswordStrength()

profile.tsx icon name: Type PREF_ITEMS.icon as React.ComponentProps<Feather>['name']

CurrencyInput.tsx: Import Text from react-native; override style prop to StyleProp<ViewStyle>

SkeletonLoader height: Change height='100%' !' style={{ flex:1 }} (expects number, not string)

create-jar-context.tsx: Add explicit CreateJarState type annotation to setState callback

Test scenarios (artifacts/api-server/src/__tests__/phase4b-webhook-concurrency.test.ts)

Scenario A 10 concurrent deliveries of the same event ID !' exactly-once ledger posting (15 assertions)

Scenario B Two event IDs for the same PI race to post !' FOR UPDATE guard prevents double contribution

Scenario C payment_intent.processing + payment_intent.succeeded concurrent !' providerStatus never regresses

& Bug 1 — Unique constraint 500 on concurrent INSERT

When 10+ requests delivered the same event simultaneously, all but one hit the unique constraint on stripeEventId. The driver threw an exception instead of returning nothing, producing 500 responses. Fix: add .onConflictDoNothing() so competing INSERTs silently yield; the existing !inserted branch then re-reads the winning row.

& Bug 2 — attemptCount set to '[object Promise]'

The existingEvent branch used a Drizzle sub-select with .then() as the SET value. Drizzle serialised the Promise object reference as the SQL parameter, sending the literal string '[object Promise]' to Postgres. Fix: replace with sql`col + 1` tagged expression.

& Bug 3 — Event stuck in 'processing' after concurrent delivery

Workers that entered the FOR UPDATE transaction and found the ledger already posted returned early without marking the event row 'processed'. A later worker's UPDATE to 'processing' (issued before its transaction) could then win, leaving the row permanently in 'processing'. Fix: mark 'processed' in every transaction exit path, including the skip branch.
