

M3Jar · Phase 4D Closure Report

Mobile Goal Management

Generated: 2026-08-05 18:31:50 UTC

Commit: 9a59de2b7463bb9c1c832c3af7b63bd03b2814b8

1. Phase Overview

Phase 4D completes the named-goal planning layer for M3Jar. Organizers can now create, edit, reorder, and archive named goals within a jar. Each goal carries a target principal amount. The screen shows real-time allocation status against the jar target and surfaces unallocated/over-target amounts for planning decisions. All accounting and funding allocation remain server-side; the mobile layer is metadata + planning only.

2. Commit Chain

Starting HEAD: 817787044323d3

ddef80975b0574fa1a1bbff634

Phase 4D commit: 9a59de2b7463

bb9c1c832c3af7b63bd03b2814b8

Remote: origin/main · github.com/
JB102298/TripJar

Push result: Success (Replit
managed GitHub integration)

3. Files Changed

API — artifacts/api-server/src/routes/

goals.ts GET returns isOrganizer +
semantic fields; PATCH/archive/reorder all
guard `TERMINAL_STATUSES`;
ReorderResult includes "inactive"

financial-summary.ts Added
unallocatedTargetCents,
savedTowardUnallocatedCents,
overTargetCents to response

Mobile Hooks — artifacts/mobile/hooks/

useJarGoals.ts Type extended with
isOrganizer, semantic fields
(unallocatedTargetCents,
savedTowardUnallocatedCents,
overTargetCents)

useFinancialSummary.ts Type
extended with same semantic fields

useGoalMutations.ts New — exports

createGoal, updateGoal, archiveGoal,
reorderGoals via customFetch (no react-
query dep)

Mobile Screen — artifacts/mobile/app/jar/[id]/

goals.tsx New — full Manage Goals
screen with create/edit form, reorder
controls, summary card, organizer/member
gating

Mobile Tests — artifacts/mobile/___tests___/

jar-lifecycle-ui.test.tsx Added vi.mock
for useJarGoals + useFinancialSummary
(Phase 4D hook render-path fix)

phase4c-action-visibility.test.tsx

Same two vi.mock additions

phase4d-manage-goals.test.tsx New
— 29 tests covering all goal management
scenarios

4. API Changes Detail

4.1 Terminal Status Guard

All four goal mutation endpoints — POST (create), PATCH (update), DELETE/archive, and PATCH/reorder — now reject requests when the parent jar status is Cancelled or Completed. Any such request returns HTTP 400 with error code BadRequest and the message "Cannot modify goals on a cancelled or completed jar".

4.2 Semantic Fields on GET /goals

FieldTypeDescription

isOrganizerbooleanTrue when the
authenticated user is the jar organizer

unallocatedTargetCentsinteger
jar.goalAmountCents " sum(active goal
targets); negative clamped to 0

savedTowardUnallocatedCentsinteger
Amount saved that flows to the
"unallocated" bucket (min of surplus,
unallocated target)

overTargetCentsintegermax(0,
savedPrincipal " jar.goalAmountCents)

unallocatedCentsintegerLegacy alias
for unallocatedTargetCents (backward
compat)

surplusCentsintegerLegacy alias for
overTargetCents (backward compat)

4.3 Semantic Fields on GET /financial-summary

Same four semantic fields (unallocatedTargetCents, savedTowardUnallocatedCents, overTargetCents, and legacy aliases) are now included in the financial summary response. All values are computed from data already present in the existing query — no additional DB round-trips.

5. Mobile Screen — app/jar/[id]/goals.tsx

5.1 Route

Expo Router path: /jar/[id]/goals — coexists with app/jar/[id].tsx (file) and app/jar/[id]/ (directory). Both resolve correctly via Expo Router's layout-and-segment rules.

5.2 Authorization Model

Data is loaded once via useJarGoals(jarId). The response includes isOrganizer. When isOrganizer is true the Add Goal button and all per-goal controls (edit, remove, move up, move down) are rendered. When isOrganizer is false those controls are omitted; the goal list and summary card remain visible to all members.

5.3 Summary Card

The top-of-screen summary card shows three columns: Jar Target, Allocated (sum of active goal targets), and Unallocated (jar target - allocated, floor 0). When overTargetCents > 0 an amber warning banner appears below the card.

5.4 Goal CRUD

Create

Tapping Add Goal opens an inline form (not a RN Modal — conditional render for reliable test behaviour). Fields: name (required), target amount via CurrencyInput (required), description (optional). On success the form unmounts and the list refetches.

Edit

Tapping the edit icon for a goal opens the same form pre-filled with existing values. updateGoal(goalId, payload) is called on save.

Remove

Tapping the trash icon shows a window.confirm / Alert.alert confirmation. On confirm, archiveGoal(goalId) is called and the list refetches. On cancel, nothing happens.

Reorder

Each goal row has Move Up (chevron-up) and Move Down (chevron-down) controls. Tapping either swaps the goal with its neighbour in a local copy, then calls reorderGoals(completeOrderedIdList). The list refetches to reflect the canonical server order.

5.5 testIDs

• add-goal-button		• goal-name-input	
• goal-description-input		• goal-form-	goal-target-input
• goal-cancel-button	error	• goal-move-up-	• goal-save-button
• goal-edit-{id}	{id}	• goal-remove-{id}	• goal-move-down-{id}
• summary-allocated		• summary-	summary-jar-target
• goal-item-{id}	unallocated		• summary-over-target

6. useGoalMutations Hook

Implemented in artifacts/mobile/hooks/useGoalMutations.ts. Uses plain `useState` / `useCallback` and `customFetch` — no `@tanstack/react-query` `useMutation`. This matches the commitment screen pattern and avoids the `QueryClientProvider` requirement that causes test failures.

MemberSignatureHTTP

submitting `boolean` True while any mutation is in-flight
error `string | null` Last server error message; cleared by `clearError()` or a new mutation attempt
clearError() `void` Resets error to null
createGoal(payload) `Promise<Goal>`
POST `/jars/:jarId/goals`
updateGoal(id, payload) `Promise<Goal>`
PATCH `/jars/:jarId/goals/:goalId`
archiveGoal(id) `Promise<{deleted,archived}>` DELETE `/jars/:jarId/goals/:goalId`
reorderGoals(ids) `Promise<{goals}>`
PUT `/jars/:jarId/goals/reorder`

9. Fresh Migration — 0000 !' 0018

Applied all 19 migration files (0000_initial_schema.sql through 0018_phase4d_jar_goals.sql) sequentially against a fresh disposable schema with ON_ERROR_STOP=1. Each file succeeded. The resulting schema contains 30 tables. The jar_goals table has the correct 10 columns.
